

Generative AI Disclosure – Group 66

1) Questions and Prompts Used

The following types of prompts were used during the development of this project:

- "We are building a car rental system that solves this problem : *gives *description of our project**. Can you help us turn this casual draft into a technical 'Purpose' statement for a database project?"
- "Here is our draft for the Vehicle entity, can you propose a rewrite of this as a formal entity description ?
- "Can you suggest professional terminology for a fleet management system? We want to describe 'cars piling up' and 'losing money by moving cars' in a more academic way."

2) Student vs AI Contribution :

The following core technical designs were implemented by students :

- Domain Choice & Ideas
- ER Schema Architecture
- Logistics Logic
- Diagramming
- Relational translation

AI contributions:

- Professional Terminology: GenAI helped translate our casual ideas into technical concepts such as "Opportunity Cost," "Asset Density," "Inventory Leveling," and "Resource Saturation."
- Prose Refinement: GenAI was used to transform our casual notes into formal, academic prose. For example, our draft regarding "people dropping cars off at Banff" was refined into "geographic demand imbalances."

Example drafts that were used as context prompts for AI :

Idea: We're building a car rental system that also solves the logistical problem : A car can be rented and dropped off at any branch in any area. Naturally the fleet will naturally get imbalances (Too many people rent a car from Toronto, go on a road trip and drop them off at Banff national park)

Our app will decide what's the most profitable way to fix this. For example: if Toronto needs an SUV, do we pay \$2,000 to ship one from Alberta (where it has low demand for SUV)? Or do we take one from our Montreal hub, which is closer and cheaper to ship, but might cost us more because Montreal has a huge population and high demand that we'd be losing out on.
